CURRENT CHART AND HISTORICAL RESEARCH

The Bitcoin Pullback Playbook

How much further could Bitcoin fall, even if July was the bottom?

The support areas, moving averages and historical pullback comparisons behind today's chart.

16.7%
below September high

20.7%
further down to July

THE COMPLETE MAP

Bitcoin at support

Snapshot from November 10. Prices and live averages move after this edition. July is a possible bottom, not a confirmed one.

KNOW WHAT EACH NUMBER MEANS

The levels on the chart

At the chart snapshot, Bitcoin was $72,798. All dollar figures below match the same chart. The support zones follow Jae's supplied chart; they are areas to monitor, not guaranteed floors.

Level	Snapshot price	Why it is marked
September 21 high	$87,374	Reference for the current pullback.
Current support	Around $73,000	Marked zone spans roughly $72,600-$73,800.
Next support	Around $70,400	Marked zone spans roughly $70,000-$71,400.
200-day simple average	$73,132	Average of the latest 200 daily closes, including today's evolving close.
50-week simple average	$75,141	49 completed weekly closes plus the current week's evolving close.
20% pullback	$69,899	20% below September's high.
22% pullback	$68,151	22% below September's high.
July 1 possible bottom	$57,735	A lower price would rule July out as the final low.

The $70.4k support area and the $68.2k-$69.9k historical comparison area are separate. A historical percentage is not evidence that buyers must appear at that exact price.

TWO AVERAGES, TWO TIME HORIZONS

The lines price has lost

The 200-day average uses about nine months of daily closes. It was near $73,132 at the snapshot, just above Bitcoin's $72,798 price. An intraday move below it is different from a completed daily close below it.

The 50-week average uses almost a year of weekly closes. The developing value was near $75,141. On November 8, the completed weekly close was $74,743, below its then-final average of $75,492. That weekly break is already recorded; this week's final close is still pending.

Average	Current reading	Completed observation
200-day	$73,132	Current daily candle is unfinished.
50-week	$75,141	Last final weekly average $75,492.

What we watch next
Whether price can finish back above the daily average, and whether a later weekly close regains the weekly line. A brief wick above an average does not confirm the same thing as a close.

In our separate 50-week study, 8 of 13 previous breaks had a higher close the next week. Four weeks later, 7 of 13 were lower. A rebound after losing the line did not settle the longer-term outcome.

These are simple moving averages, not exponential averages. Weekly candles use Monday-Sunday UTC. Historical weekly breaks require completed closes. Repeated breaks can occur in the same recovery; these are not 13 independent cycles.

THE RECOVERY STUDY BEHIND THE COMPARISON

12 of 16 reached 20% or more

We measured 16 pullback legs across three recoveries associated with the 2015, 2018 and 2022 cycle lows. 12 reached at least 20%. The middle measured decline was 21.925%, rounded to about 22%.

These include later pullbacks inside each recovery. They are not 16 first pullbacks after 16 different bear markets, and 12 of 16 is not a calibrated 75% probability for today.

The 2015 measured sequence starts at the August higher low, not January's final bottom. Original measurements use Bitfinex for 2015 and Binance for 2018/2022. Current chart levels use Bitstamp. The series and measurement choices are preserved, not silently pooled into one new test.

THE COMPLETE RECOVERY SAMPLE

Every measured pullback

Recovery	Pullbacks	20% or more	Median decline
2015	6	5	-31.66%
2018	5	2	-18.00%
2022	5	5	-21.27%

Recovery	Pullback in sequence	Decline
2015	1	-40.42%
2015	2	-25.80%
2015	3	-13.86%
2015	4	-29.66%
2015	5	-36.94%
2015	6	-33.65%
2018	1	-20.20%
2018	2	-12.56%
2018	3	-10.34%
2018	4	-18.00%
2018	5	-35.15%
2022	1	-22.58%
2022	2	-20.00%
2022	3	-20.87%
2022	4	-21.27%
2022	5	-33.58%

The pooled median is 21.925%. It is the middle of all sixteen declines, not the average of the three cycle medians. The founder's corrected 2018 fourth pullback is -18.00%.

TRANSLATE THE STUDY INTO DOLLARS

How the price comparisons work

Start with September's $87,373.64 high. The 20% and 22% lines both use that same reference price.

Comparison	Calculation	Price
20% decline	$87,373.64 x 0.80	$69,898.91
22% decline	$87,373.64 x 0.78	$68,151.44
Current decline	($72,798.25 / $87,373.64 - 1) x 100	-16.68%

The feed chart rounds those comparisons to $69.9k-$68.2k. The measured study median of 21.925% gives $68,216.97; using a rounded 22% gives $68,151.44. Both round to about $68.2k at the chart's precision.

Now change the reference to today's price. Reaching July's $57,734.63 low from $72,798.25 would be another 20.69% decline. That is the chart's 20.7% further-down arrow.

Different question	Correct reference
How far below the rally high?	September high: $87,373.64
How much further down to July?	Current price: $72,798.25

A 20% pullback from the rally high is not another 20% drop from today. The first has already partly happened. Keeping those reference prices separate prevents an exaggerated downside target.

KEEP THE BOTTOM QUESTION SEPARATE

July remains a possible bottom

July's low is still below the current price, the next marked support zone, and both historical comparison levels. A deeper autumn selloff can therefore fit inside a recovery without making a new cycle low.

What would rule July out?
A price below $57,734.63. Holding above it does not, by itself, prove that the final bottom is confirmed.

Our working bottom window remains open through November 16. That is our timing view. The 16 measured pullbacks do not prove this date or turn it into a forecast probability.

What to check	What it helps distinguish
Price versus the $73k support area	A wick through the zone versus trading persistently below it.
The next $70.4k zone	A separate chart area, not the 20%-22% study result.
Daily and weekly closing prices	A live intraday move versus a completed average break or reclaim.
The September high and July low	A recovery pullback versus a new cycle low.

This playbook supplies context and measurements. It does not test an entry, stop or take-profit strategy, and the marked levels are not guaranteed buying opportunities.

SOURCES, DEFINITIONS AND THE OLDER STUDY

What this guide is based on

Current chart. Bitstamp BTC/USD daily candles and ticker, retrieved November 10, 2026 at 12:09 p.m. Eastern. The current day and week are unfinished. The original reference screenshot used Bybit BTC/USDT perpetuals, so venue prices and averages can differ slightly.

Support areas. Approximate zones from Jae's supplied chart: around $73k and $70.4k. They are not a fresh Fibonacci calculation. The older Stories' linear July-to-September 50% retracement near $72,554 is a different drawing.

Recovery sample. Sixteen founder-measured pullbacks across three recovery sequences. The figures are reproduced in full on page 6. They describe selected historical legs; they do not establish an independently tested trading edge.

The older 70-rally study is a different sample. It measured rallies of 40% or more across different environments. In that frozen snapshot, 55 of 70 pullbacks reached 20%, and the median decline was 32.05%. Those are not the same observations as the 16 recovery legs or the source of today's roughly 22% comparison.

We preserved the October 9 edition as a dated archive. It contains the original broad-rally tables, recovery leg details and lower-high break research, along with old market snapshots. Use this November 10 playbook for the current chart and levels.
