FIVE RED WEEKS. WHAT HAPPENED NEXT?

The Red-Week Study

Every qualifying Bitstamp streak since 2012, the next 30, 60 and 90 days, and the recoveries after earlier major lows.

4
Earlier five-plus runs

30 / 60 / 90
Exact calendar-day returns

3
Past recovery windows

Five red weeks are complete through November 8. The current week is still open. July remains a possible bottom, not a confirmed one.

READ THESE TWO NUMBERS DIFFERENTLY

A DIP ALONG THE WAY IS NOT THE ENDING RETURN

The carousel asks two separate questions. How much lower did price trade during the next four weeks? And where did it close exactly 30, 60 and 90 days after the fifth red weekly close?

APRIL 2014 EXAMPLE	PRICE OR CHANGE
Fifth red weekly close, April 13	$416.30
Lowest price during the following four weeks	$408.00, down 2.0%
Daily close 30 days later, May 13	$439.12, up 5.5%

That case dipped first and finished day 30 higher. There is no contradiction between a negative lowest-point measurement and a positive later closing return.

A red weekly candle closes below that same week's open. It is not defined by whether its close is below the previous week's close. Weeks run Monday through Sunday in UTC.

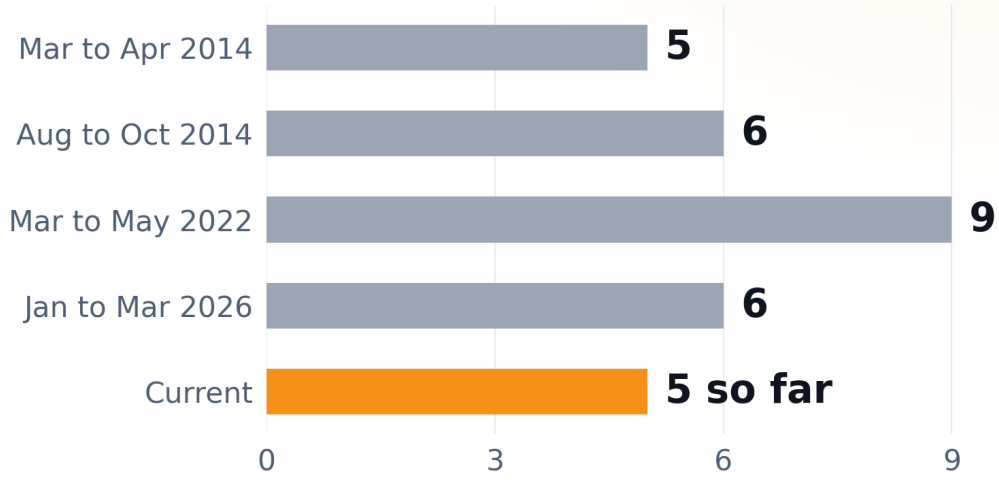

All four previous cases had a further dip within four weeks. Two were higher and two were lower at each of the 30, 60 and 90-day closing checkpoints.

Four weeks means 28 days. The longer return checks use exactly 30, 60 and 90 calendar days. The reference price for every comparison is the first fifth completed red weekly close.

EVERY QUALIFYING EPISODE

FIVE RUNS IN THE PRIMARY HISTORY

FIRST RED WEEK STARTS	FIFTH RED WEEK ENDS	TOTAL RED WEEKS	FIFTH CLOSE
2014-03-10	2014-04-13	5	$416.30
2014-08-25	2014-09-28	6	$375.35
2022-03-28	2022-05-01	9	$38,488.34
2026-01-19	2026-02-22	6	$67,612.00
2026-10-05	2026-11-08	5 so far	$74,742.52

Bitstamp BTC/USD · full weeks since 2012

A six-week or nine-week streak is counted once, when it first reaches five completed red weeks. It does not create another independent event on every extra red week.

Primary sample begins with the full week starting January 2, 2012. Historical final run lengths are known afterward. The current count is five completed weeks, with no assumption about the open week.

THE REQUESTED LONGER VIEW

30, 60 AND 90 DAYS LATER

FIFTH WEEKLY CLOSE	30 DAYS	60 DAYS	90 DAYS
2014-04-13	+5.5%	+36.7%	+53.3%
2014-09-28	-4.9%	-1.4%	-15.7%
2022-05-01	-17.5%	-48.2%	-38.6%
2026-02-22	+4.3%	+15.8%	+13.4%
2026-11-08	Pending	Pending	Pending

Two cases were higher and two were lower at every checkpoint. April 2014 was up 53.3% by day 90. The May 2022 case was still down 38.6% at that point.

The size and direction of the later move varied sharply. A streak by itself did not identify a uniform path. These four prior cases are too few to turn the counts into reliable odds for today.

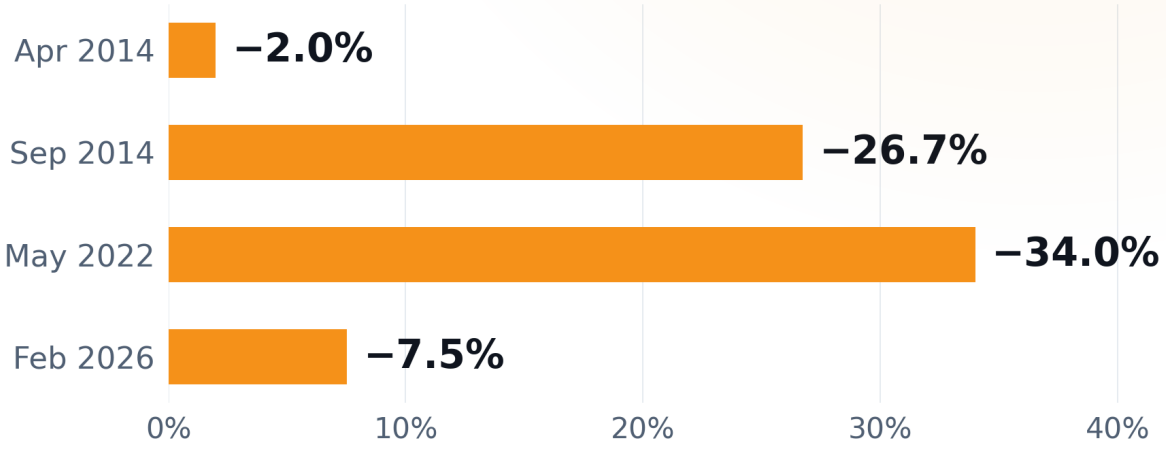

CURRENT FIFTH CLOSE	30-DAY DATE	60-DAY DATE	90-DAY DATE
2026-11-08	2026-12-08	2027-01-07	2027-02-06

Daily UTC closing prices, measured from the fifth weekly close. Pending means the exact future date has not arrived. These are price changes, not trading profits or returns after fees.

THE SELLOFF BEFORE ANY LATER CLOSE

THE LOWEST POINT DURING FOUR WEEKS

FIFTH WEEKLY CLOSE	REFERENCE PRICE	LOWEST NEXT 4W	FURTHER DIP
2014-04-13	$416.30	$408.00	-2.0%
2014-09-28	$375.35	$275.00	-26.7%
2022-05-01	$38,488.34	$25,401.05	-34.0%
2026-02-22	$67,612.00	$62,525.00	-7.5%

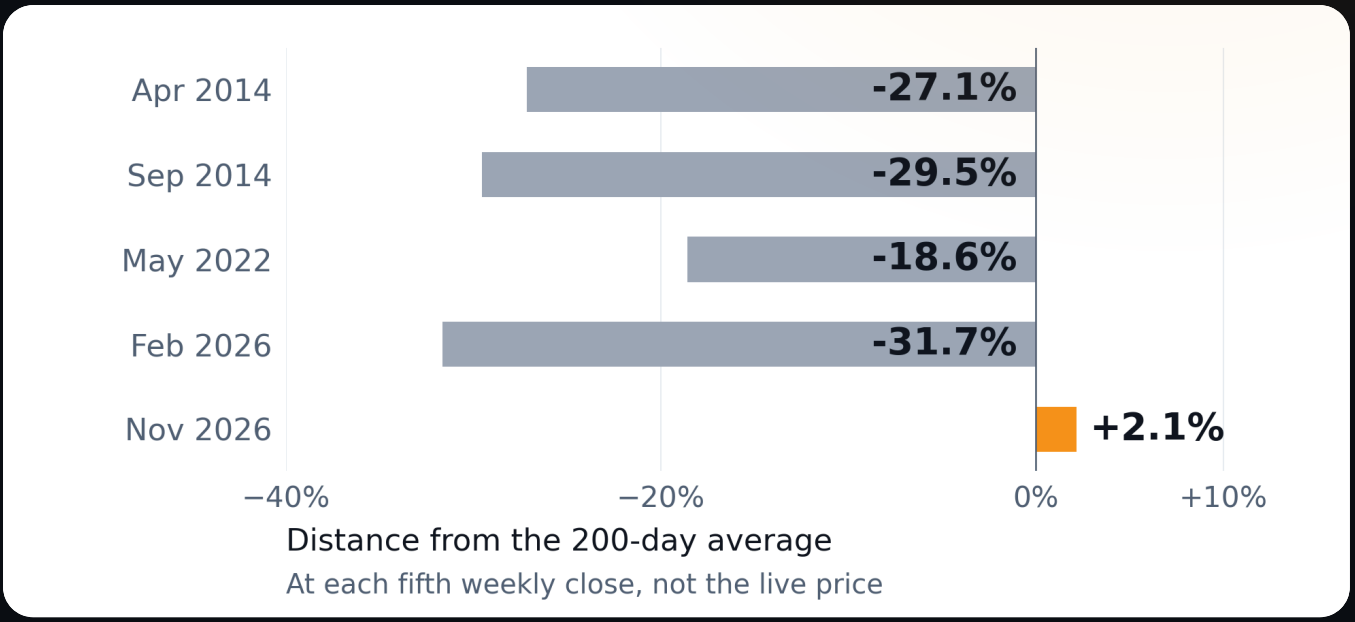

This table shows the deepest traded dip below the reference close during the next 28 days. It does not say that every case was still down at the end of that period.

The fifth red week itself is excluded from this forward-low calculation. A lower price earlier in that same fifth week is a different measurement. A lowest trade is also different from a daily or weekly closing price.

THE TREND AT THE SIGNAL

THE EARLIER FOUR WERE BELOW THE 200-DAY AVERAGE

FIFTH WEEKLY CLOSE	BITCOIN CLOSE	200-DAY AVERAGE	DISTANCE
2014-04-13	$416.30	$571.35	-27.1%
2014-09-28	$375.35	$532.63	-29.5%
2022-05-01	$38,488.34	$47,275.69	-18.6%
2026-02-22	$67,612.00	$98,928.84	-31.7%
2026-11-08	$74,742.52	$73,170.61	+2.1%

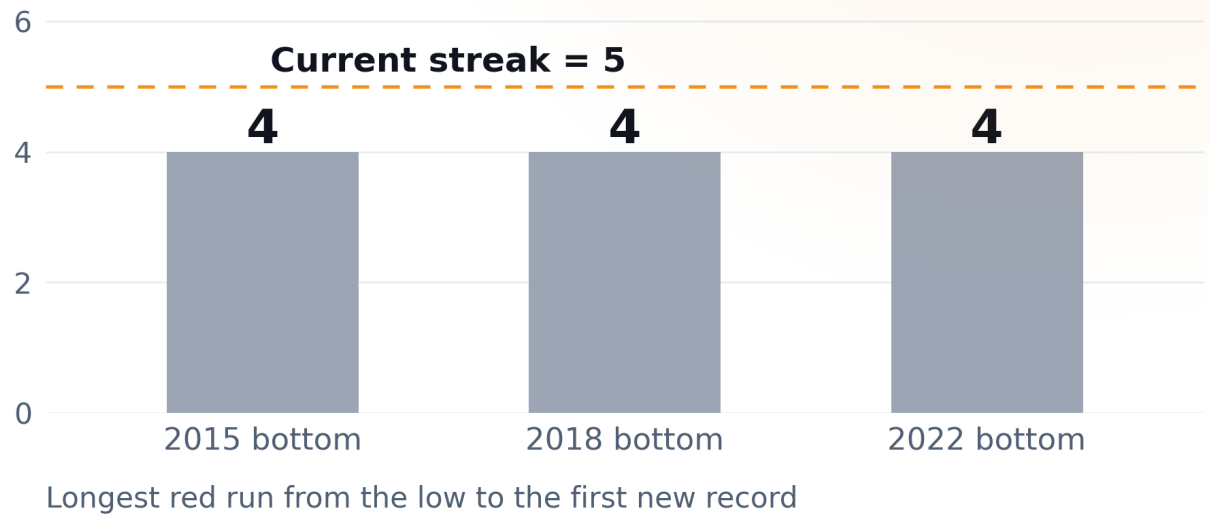

The 200-day average uses the latest 200 completed daily closes, including the Sunday of the fifth weekly candle. It is one way to describe the price trend.

All four older fifth closes were below their own averages. November 8 was above it. That difference means the older cases are not identical trend matches. This table does not describe a live quote or prove a bull-market label.

CAN RED WEEKS HAPPEN AFTER A BOTTOM?

FOUR WEEKS HAPPENED IN EVERY RECOVERY

KNOWN MAJOR LOW	FIRST NEW RECORD ON BITSTAMP	LONGEST RED RUN
2015-01-14	2017-02-23	4
2018-12-15	2020-11-30	4
2022-11-21	2024-03-05	4

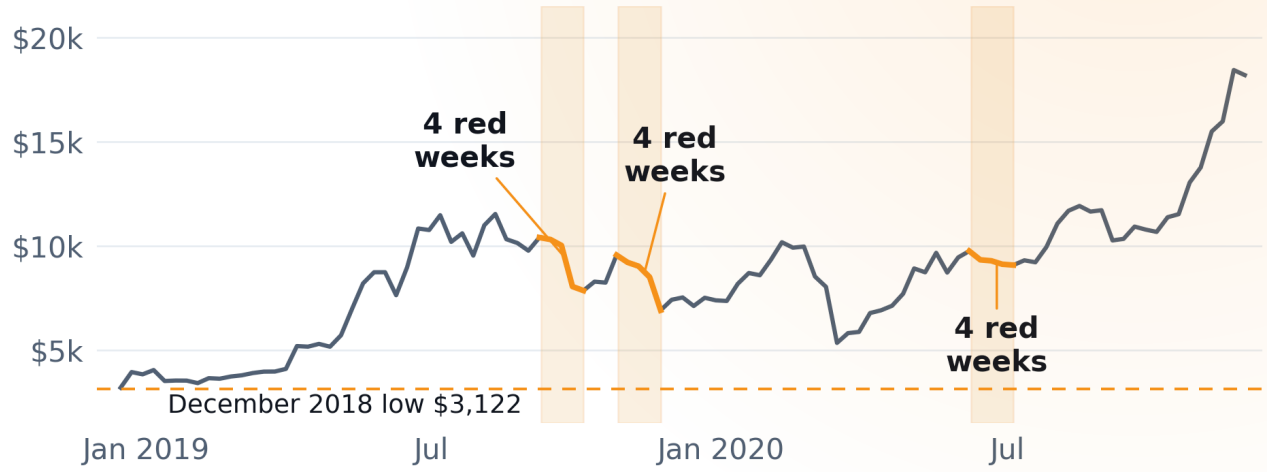

All three recovery windows contained a four-week red streak. None reached five consecutive red weeks before first trading above the previous cycle's high.

These lows are known with hindsight. We require each counted weekly candle to start after the low and end before the first new record. July 2026 is not classified as a confirmed cycle low. The comparison does not cover every possible definition of a bull run.

THE FULL DECEMBER 2018 RECOVERY

THREE LOSING STREAKS. THE OLD LOW HELD.

Weekly closes · orange marks the three four-week runs

FIRST RED WEEK STARTS	LAST RED WEEK ENDS	RED WEEKS	RUN PRICE CHANGE
2019-09-09	2019-10-06	4	-24.4%
2019-10-28	2019-11-24	4	-27.6%
2020-06-08	2020-07-05	4	-7.0%

The run-price change starts at the first weekly open and ends at the last red weekly close. These figures describe the four-week runs themselves. They are not the 30, 60 or 90-day forward returns in the earlier table.

All three runs came after the December 15, 2018 low at $3,122.28. That low remained intact through the recovery window. These are four-week examples, not historical five-week recovery matches.

WHAT THIS MEANS FOR THE CURRENT COMPARISON

JULY IS STILL POSSIBLE, NOT CONFIRMED

20% drop
$69.9k

22% drop
$68.2k

Historical comparison, not a target

REFERENCE OR SCENARIO	PRICE
September 21 high	$87,373.64
20% below that high	$69,898.91, about $69.9k
22% below that high	$68,151.44, about $68.2k
July 1 candidate low	$57,734.63, about $57,735

Our separate recovery study measured 16 pullbacks across three recoveries. Twelve reached at least 20%, and the median was 21.925%, rounded to about 22% in the carousel.

The 20% and 22% levels above are comparisons from September's high, not price targets or the odds of reaching them. The 16 manually measured recovery pullbacks are a separate sample from the four older five-week red streaks.

CHECK THE ARITHMETIC

EVERY HISTORICAL CLOSING-RETURN INPUT

FIFTH CLOSE	DAYS	TARGET DATE	START CLOSE	END CLOSE	CHANGE
2014-04-13	30	2014-05-13	$416.30	$439.12	+5.5%
2014-04-13	60	2014-06-12	$416.30	$569.10	+36.7%
2014-04-13	90	2014-07-12	$416.30	$638.10	+53.3%
2014-09-28	30	2014-10-28	$375.35	$356.96	-4.9%
2014-09-28	60	2014-11-27	$375.35	$369.98	-1.4%
2014-09-28	90	2014-12-27	$375.35	$316.47	-15.7%
2022-05-01	30	2022-05-31	$38,488.34	$31,762.76	-17.5%
2022-05-01	60	2022-06-30	$38,488.34	$19,924.89	-48.2%
2022-05-01	90	2022-07-30	$38,488.34	$23,644.58	-38.6%
2026-02-22	30	2026-03-24	$67,612.00	$70,519.00	+4.3%
2026-02-22	60	2026-04-23	$67,612.00	$78,269.00	+15.8%
2026-02-22	90	2026-05-23	$67,612.00	$76,655.99	+13.4%

Return = 100 x (end close / start close - 1). A daily candle labelled May 13 closes at the end of May 13 UTC. That is exactly 30 days after the end of the April 13 reference candle.

Dollar inputs retain cents. Displayed percentages are rounded to one decimal. The full precision is retained in the private research outputs. No nearest-date substitution, weekly approximation or incomplete daily candle is used.

KEEP THE SIGNAL IN PERSPECTIVE

HOW TO READ THE NEXT WEEKLY CLOSE

1. Count completed weeks. An open candle can change direction before Sunday's close.
2. Keep the reference fixed. Every result in this study starts at that episode's first fifth red weekly close.
3. Separate the dip from the ending return. Price can fall during the window and still finish it higher.
4. Compare the trend and recovery stage. The current above-average fifth close differs from all four older primary events.
5. Keep July unconfirmed. A green weekly candle ends a red streak; it does not establish the final cycle low.

This is a descriptive study. It does not test an executable entry, stop, exit, fees or position size. It does not establish a profitable trading strategy.

Bitstamp and Binance can classify a tiny candle differently. Binance has a five-week run in late 2018 that Bitstamp does not. Counts from the two venues are kept separate.
