THE ACCUMULATION PLAN

How to Buy the Bitcoin Bottom Without Timing It.

You cannot know the exact day or price Bitcoin bottoms, and a date the whole crowd is watching is the easiest thing to front-run. So you stop guessing one day. You ladder in across the whole window and buy more the lower it goes. This is that plain-English plan.

1 date

is the fragile way to buy, and the easiest thing for the crowd to front-run

Aug to Nov

the window you ladder across, instead of betting it all on one day

No timing

the plan is built so no single price ever has to be right

Compiled July 22, 2026. A framework for accumulating through a Bitcoin bottoming window, with illustrative zones anchored to the public power-law floor shown on bitcoin-daily.com/cycle. These are illustrative levels, not a live buy signal. Education, not financial advice. Bitcoin is volatile, dollar cost averaging does not guarantee a profit, and price can always fall further.

Why one date is a fragile bet

THE PROBLEM

Everyone wants the same thing near a bear market low. The exact day and the exact price Bitcoin bottoms, so they can put all their money in at the perfect moment. Here is the honest truth. Nobody can know that in advance, not us, not anyone. You only ever find the bottom in the rear-view mirror.

It gets trickier this cycle. The four-year clock points at roughly October, and that has become the most-watched trade on the whole internet. A date that everyone is staring at is the easiest thing in a market to front-run. Bigger players buy ahead of the crowd, which can pull the low earlier, into September, or make it messy and choppy instead of one clean bottom.

This is not new. Every famous known-date edge in market history has faded the same way. The old January effect in stocks worked until everyone knew it, then it crept earlier and earlier as traders raced to get in first, and eventually it stopped paying. The moment a date is obvious, it stops being a gift.

When will Bitcoin bottom, and at what price?

https://youtu.be/2SeFTuTI_N0

The honest part. Anyone selling you the precise day and dollar of the bottom is guessing. The fix is not a better guess. The fix is a plan that does not need you to guess at all.

The fix in one idea

LADDER, DO NOT GUESS

Instead of trying to nail one perfect day, you spread your buying across the whole window and you buy bigger the lower price goes. That is the entire idea. You never have to be right about the date, because you are buying a little the whole way down and a lot when it gets cheap.

Think of your accumulation money as one hundred percent of a pot you have set aside. You are going to put it to work in three simple streams at the same time. Some of it buys fixed zones on the way down. Some of it drips in a little every day. And some of it stays in reserve for a violent flush or a low that shows up early.

50%

The level ladder. Buy the zones.

30%

The daily drip. Average through the chop.

20%

Dry powder. Reserve and backstop.

The one-sentence version. Ladder in across the window and buy more the cheaper it gets, so that no single day and no single price ever has to be the right one.

Stream one, the level ladder

BUY THE ZONES

About half of your pot is the level ladder. You set a few price zones below today's price, and you buy a chunk each time Bitcoin closes into a new lower one. The trick is that the chunk gets bigger the deeper price falls, so you are committing the most money exactly when Bitcoin is cheapest and fear is highest.

An illustrative ladder. Each bar is how much of your pot you commit as price steps down into a new lower zone. The buys get bigger the lower it goes, and at the deepest zone your violent-flush reserve gets spent too, so your firepower is largest right at the bottom. Illustrative zones, not a live buy signal.

ILLUSTRATIVE NEW-LOW ZONE	BUY THIS MUCH OF YOUR POT
First new low, about \$55k to \$58k	10%
About \$50k to \$55k	13%
About \$45k to \$50k	16%
Below about \$45k, a deep flush	11% + reserve

Why these numbers are illustrative. The zones above are anchored to the public power-law floor, which sits near \$57,000 to \$58,000 today on bitcoin-daily.com/cycle. They are a template to show the shape of the plan, not an instruction to buy at those exact prices right now. The live version, re-pegged as price and the floor move, is what we keep sharp for members.

Stream two, the daily drip

AVERAGE THROUGH THE CHOP

The ladder only fires when price steps into a new zone. But real bottoms are rarely one clean drop. They grind sideways for weeks, chopping up and down in a range while everyone slowly gives up. If you only had the ladder, you would sit on your hands through all of that.

So about a third of your pot is a daily drip. On any day price is below the floor and just chopping around, you buy about 1 percent of your pot. That is it. A small, boring, automatic buy that keeps you averaging in through the whole messy stretch. If you want it to last longer, you can halve it to half a percent a day.

One simple on and off switch. The drip runs while price is below the floor and quiet. If price climbs back above the floor, you pause it. If it drops back below, you start again. No prediction needed, you are just steadily averaging while Bitcoin is in the low zone.

Stream three, the dry powder

RESERVE AND BACKSTOP

The last fifth of your pot is dry powder, and it does two jobs. The first is the easy one. You hold some back, around ten percent, for a single violent flush, the kind of gift candle where price stabs far below everything for a day. If that comes, you already have cash ready to buy it.

The second job is the one most people forget, and it is the exact fear this whole plan is built around. What if the low comes early and shallow. What if the crowd front-runs October, Bitcoin only dips a little, and then it turns back up while you are still mostly in cash waiting for cheaper prices that never arrive. You would have been too clever and missed the whole thing.

The anti-miss rule fixes that. If the window is running out and you are still badly under-invested because the deep zones never printed, you simply start deploying the rest on a steady schedule, a few percent a week, through the end of the window. Owning a full position at a decent average beats sitting in cash forever, waiting on a low that already passed you by.

The point of the backstop. A great average across the window beats a perfect entry you never actually got. The reserve means a deep flush cannot catch you empty, and the anti-miss rule means an early, shallow low cannot leave you stranded on the sidelines.

The rules that keep it clean

STAY DISCIPLINED

A plan only works if you follow it the same way on scary days and greedy days. These are the guardrails that stop you from fooling yourself, and they are simple enough to check in a few seconds.

1 A new low means a daily close, not a wick.

A rung only fires on a daily close below the lowest close this cycle has already made. Ignore quick intraday spikes down that snap back the same day, so you are only buying real new lows, not noise.

2 Never chase green.

You only add on a new low or during quiet, sideways consolidation. You never buy into a rally. If you feel the fear of missing out on a green candle, that is the signal to sit on your hands.

3 If it breaks up first, shift to plain DCA.

If price reclaims fair value and breaks upward before the deep zones ever print, you are already partly in from the higher rungs. Just switch to normal, steady buying instead of waiting for a low that is not coming.

Why the close matters. Prices often spike down for a few minutes and snap right back, and those fake wicks would trigger buys at levels the market never really accepted. Waiting for the daily close to confirm a new low keeps you buying real weakness, not a passing scare.

Why this beats waiting for one date

THE MATH

Here is the quiet magic of buying this way. When you spread your buys across the whole window, your final cost is simply the average of everywhere you bought. You do not need to catch the exact low, because your average already includes the cheap days. This is what people mean by dollar cost averaging, and it is why it removes the need to be right on timing.

A simple illustration, not a forecast. The orange dots are ladder and drip buys spread across the window, and the green line is the average they add up to. The single red dot is one all-in guess that bought early because the crowd front-ran the date, and missed the lower prices that came later. No price on this chart is a prediction.

Be honest with yourself about what this does and does not do. Dollar cost averaging does not guarantee a profit, and it does not remove risk. Bitcoin can keep falling well past every zone you drew, which is exactly why the plan scales buys up with depth and holds dry powder back. What averaging removes is the need for perfect timing, not the risk itself.

The honest takeaway. Size this to your own risk and never invest money you cannot afford to hold through a deeper and longer drawdown than you expect. The ladder is a way to be calm and consistent while the crowd panics, not a promise about where the bottom is.

The data desk that zooms out

You have the plan. Want the live levels?

The whole method is yours in this guide, free. The ladder, the daily drip, the dry powder, the anti-miss backstop and the new-low rule. The part that changes as price moves is the live layer. The exact zones re-pegged to today's floor, the daily read on whether this is a buy day or a wait day, and a place to stay accountable so you actually follow the plan instead of freezing.

Every morning inside the community we publish the one number and the one chart that actually moved Bitcoin, in plain English, plus the live cycle read and the accumulation levels this guide only sketches. No hopium, no fear, just the desk note.

THE DEEP-DIVES BEHIND THIS PLAN

When will Bitcoin bottom, and at what price?

https://youtu.be/2SeFTuTI_N0

July bull trap plus an Aug/Sept crash risk

<https://youtu.be/frWUanOpKLo>

Is the 4-year cycle real? I did the research

<https://youtu.be/fPpKZ9SE5uc>

Compiled July 22, 2026. This is an educational framework, not financial advice, and not a recommendation to buy or sell. The dollar zones are illustrative anchors around the public power-law floor, not price predictions, and price can fall below all of them. Dollar cost averaging does not guarantee a profit and does not remove risk. Bitcoin is volatile. Size any plan to your own risk and never invest more than you can afford to hold through a deeper drawdown. Everything here is a framework or a scenario, never a promise or a single dated price.
