

THE SUPERTREND STUDY

Every weekly Supertrend flip on Bitcoin since 2012, buy and sell, with the exact settings on the chart everyone is sharing, graded at 4, 12 and 26 weeks against any random week.

The record, the dips hiding inside the wins, the one flip that was the top, and the September 2026 flip measured against all of them.

6 of 7

buy flips higher 26 weeks later

3 of 7

dipped 20% or more inside those 26 weeks

10 wks

after the low this flip printed, the earliest on record

Educational, not financial advice. Seven prior flips is a small sample and is treated as one. The rule is TradingView's own Supertrend logic so the chart being shared and this study are the same object.

THE DEFINITION

WHAT SUPERTREND IS, AND HOW IT WAS GRADED

Supertrend draws a line a fixed distance from price, three times the average true range over the last ten weeks, and lets that line trail price. While price is above it the line sits below and the indicator reads buy. When a weekly close falls through the line, it flips to the other side and reads sell, and the reverse on the way up. It is a trailing stop with a name. It cannot flip on a wick, only on a close, and the distance is wide, so it flips rarely.

The settings. ATR period 10, multiplier 3, weekly bars, Bitstamp BTC/USD, the average true range smoothed the way TradingView smooths it. The chart being shared was made on the morning of 7 September 2026, right after the 6 September weekly close, and this rule flips to buy on exactly that close, at \$80,339 with the line at \$60,653. The buy label on the shared chart sits on the line, which is why it reads as roughly \$63,000 rather than the price.

The grading. For every buy flip since the first full year of Bitstamp data, the close 4, 12 and 26 weeks later, compared with the same horizons from every week since October 2011. The worst dip inside those 26 weeks, on weekly lows, wicks. A whipsaw is a sell flip within 8 weeks. The lag is the weeks between the lowest close of the prior year and the flip, and how far price had already risen from that low. Sell flips are graded the same way, plus the best rally inside 26 weeks, because a sell that was followed by a rally is the mirror-image failure.

THE COUNT

8 buy flips and 7 sell flips in fifteen years. It fires about once a year. That rarity is the source of its reputation and the reason the sample is small.

THE SCOREBOARD

BUY FLIPS, SELL FLIPS, ANY WEEK

SIGNAL	N	+4 WEEKS, UP	+12 WEEKS, UP	+26 WEEKS, UP	WORST DIP IN 26W
buy flips	7	+15.7% / 86%	+33.5% / 71%	+55.5% / 86%	-14%
sell flips	7	+2.5% / 71%	+14.7% / 86%	-14.1% / 43%	-36%
any week	755	+2.5% / 57%	+10.7% / 60%	+35.4% / 66%	

Medians. 'up' = share with a higher close. The September 2026 buy flip has no forward history yet and is not in the buy row.

The buy flip has the best record of any signal this page has graded in September. Four weeks later +16%, twelve weeks +34%, twenty-six weeks +56% with 6 of 7 higher, against +35% for any random 26 weeks. The sell flip is the mirror. Six months after a weekly sell, price was lower a median 14%, and the November 2025 sell, the one this bear started with, was 18% lower six months on. That is what a slow trailing stop is supposed to do, and on Bitcoin it has mostly done it.

every weekly Supertrend BUY flip on Bitcoin since 2012. 6 of 7 higher six months later, median +56%. 3 o

BUY FLIPS

ALL 8 WEEKLY BUY FLIPS

FLIP	PRICE	+4W	+12W	+26W	WORST DIP 26W	WHIPSAW 8W	LAG FROM LOW
15 Jul 2012	\$8	+52%	+55%	+80%	-13%		38 wks, +233%
20 Oct 2013	\$167	+187%	+407%	+200%	-21%		51 wks, +1481%
12 Jul 2015	\$311	-15%	-23%	+45%	-36%		25 wks, +47%
21 Apr 2019	\$5,296	+55%	+92%	+56%	-7%		18 wks, +66%
02 Aug 2020	\$11,072	+6%	+18%	+199%	-11%		20 wks, +107%
10 Oct 2021	\$54,715	+16%	-13%	-23%	-40%		52 wks, +381%
22 Jan 2023	\$22,717	+7%	+34%	+32%	-14%		9 wks, +40%
06 Sep 2026	\$80,339				-5%		10 wks, +35%

Worst dip on weekly lows. Lag = weeks since the lowest close of the prior 52 weeks, and gain from it.

Inside the wins there were dips. The median worst dip in the 26 weeks after a buy flip was 14%, and three of seven dipped 20% or more first, October 2013 by 21%, July 2015 by 36%, October 2021 by 40%. Two of those three went on to be higher six months later anyway. The one that did not, October 2021, flipped to buy four weeks before the all-time high and printed below its prior high on the day it flipped, which is the one structural feature it shares with September 2026.

None of the seven reversed to a sell within eight weeks. That is the strength of a wide, slow line. It also means that when it is wrong, as in 2021, it stays wrong for months. The signal is sticky in both directions.

SELL FLIPS

ALL 7 WEEKLY SELL FLIPS

FLIP	PRICE	+4W	+12W	+26W	WORST DIP 26W	BEST RALLY 26W
07 Jul 2013	\$74	+30%	+72%	+1124%	-15%	+1472%
02 Mar 2014	\$566	-19%	+1%	-15%	-40%	+25%
04 Feb 2018	\$8,191	+40%	+15%	-14%	-29%	+44%
24 Nov 2019	\$6,908	+9%	+43%	+26%	-44%	+52%
23 May 2021	\$34,707	+3%	+36%	+69%	-18%	+99%
09 Jan 2022	\$41,876	+1%	+11%	-50%	-58%	+15%
16 Nov 2025	\$94,187	-6%	-25%	-18%	-36%	+14%

Best rally = highest weekly high inside the 26 weeks after the sell flip.

Four of seven sell flips were lower six months later, including the three that opened bears, March 2014, January 2022 and November 2025. The misses were July 2013, which sold into the 2013 run, and the two mid-cycle shakeouts of November 2019 and May 2021, both of which rallied hard inside 26 weeks. Read alongside the buy table, the pattern is that the indicator is right about the big turns and wrong about the mid-trend scares, in both directions.

THE LIVE CASE

SEPTEMBER 6, 2026, THE **EARLIEST** FLIP ON RECORD

The median buy flip printed 25 weeks after the low with price already up 107% from it. The 2026 flip printed 10 weeks after the July 1 low with price up 35%. It is the earliest and the smallest of all eight. The closest analog is January 2023, nine weeks and +40%, which dipped 14% first and was 32% higher six months later. The second closest is July 2015, 25 weeks and +47%, which dipped 36% first and was 45% higher six months later. Both ran. Both dipped first.

Two things are true at once. The buy flip has the best base rate of any signal graded this month, six of seven higher six months later. And it printed below the bear's last lower high at \$82,833, which is the structural definition this page has used all year, and which only the October 2021 flip shares, the one that became the top. The honest reading is that the signal and the structure disagree, and that above \$82,833 on a daily and weekly close they would agree.

THE TEST

This is a study, not a call. The best-looking signal on the board still had a one in seven record of being the top. The line above it decides.

WHAT THIS STUDY DOES NOT SAY

Seven flips is seven flips. A six-of-seven record on a sample that size is encouraging and nothing more. One more 2021 would make it five of eight.

Weekly bars, one exchange, one setting. A different multiplier flips on a different week, sometimes weeks earlier. The setting used here is the one on the chart being shared, which is the only reason it was chosen.

Bull markets flatter every trend signal. Six of the seven prior flips printed outside structural bear markets, and Bitcoin spent most of that time going up. The 2026 flip is the first to print inside one. There is no history for that case, which is exactly why it is written down here rather than assumed.

Data pinned 15 September 2026. Bitstamp BTC/USD daily resampled to weekly, Monday to Sunday. Scripts: Supertrend/weekly_flips.py, st_charts.py. This is education, not financial advice.
